

React JS

API

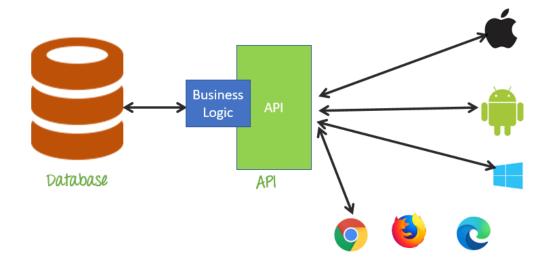

What is API?

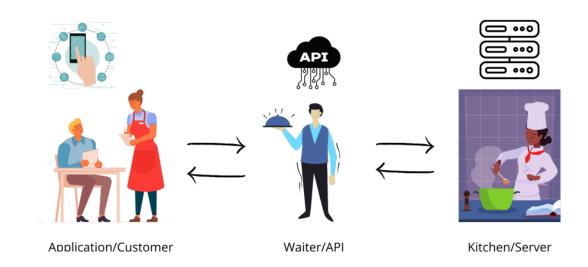

How API Works

Tools to Test API

- PostMan
 - https://www.postman.com/ (Desktop)
 - https://web.postman.co/ (Web)

- https://www.thunderclient.com/ (VS Code Extension)
- insomnia
 - https://insomnia.rest/
- Firecamp
 - https://firecamp.io/

Mock API

- https://jsonplaceholder.typicode.com/
- https://fakestoreapi.com/
- http://dummyjson.com/
- https://fakejson.com/
- https://regres.in/
- https://dummyapi.io/explorer
- https://gorest.co.in/
- https://www.mockaroo.com/
- http://dummy.restapiexample.com/

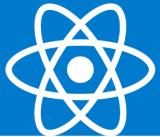

Partner API

- https://newsapi.org/
- https://openweathermap.org/api
- https://spoonacular.com/food-api

API Testing

IMP

Ask Question ?

- Where is API URL?
- Which method is used in API ? (GET/POST)
- Is there any Parameter ?
- Is there any Authtentication ?

CheckList?

- 1-Test API in PostMan
- 2-Check Status Code
- 3-Check Response in Postman as JSON
- 4-Copy paste response in jsonlint and validate it. (Optional)
 - https://jsonlint.com/

API URL

Method : Get

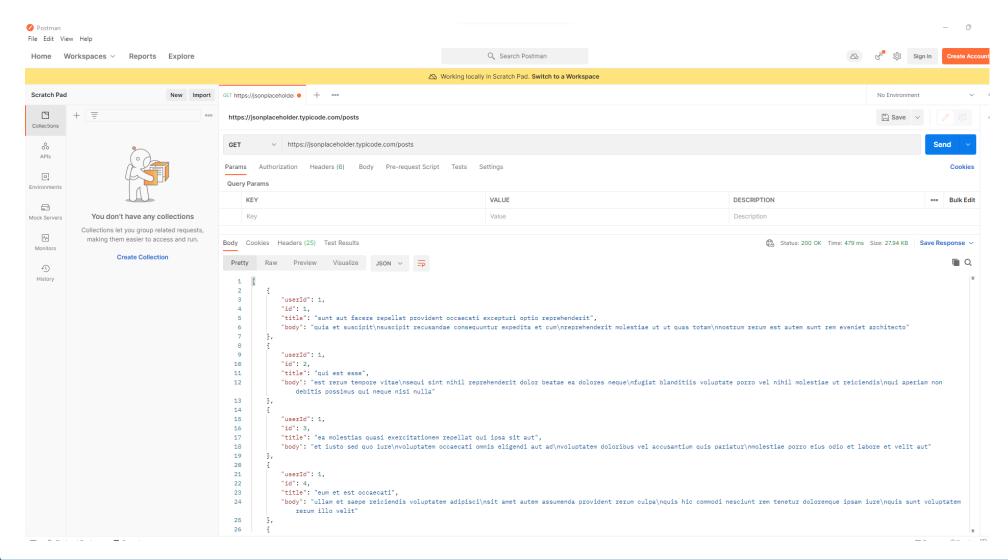

Use: List Details

• URL : https://jsonplaceholder.typicode.com/posts

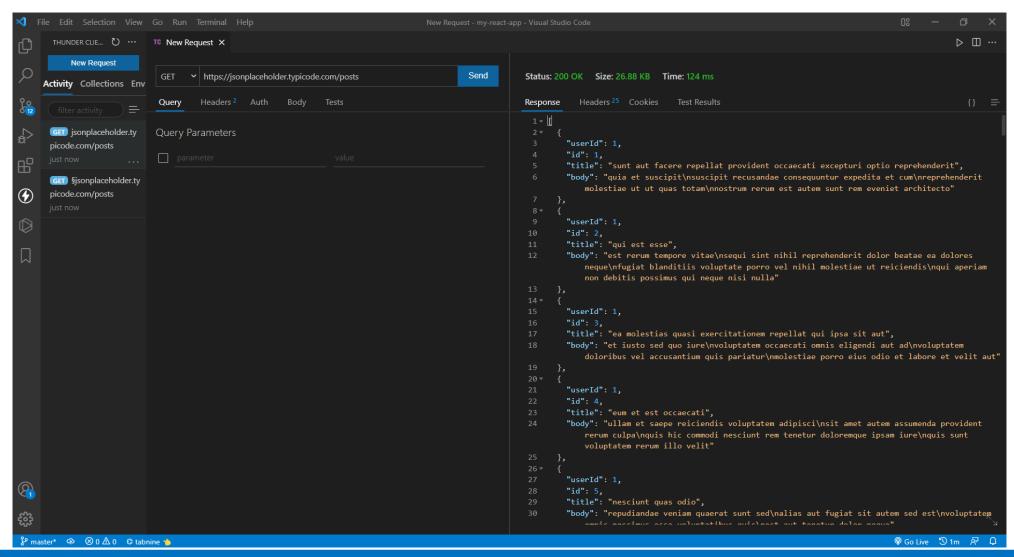

Post Man

Thunder Client

API Call

- We can call API Using 2 Methods
 - JS Fetch Method
 - Axios NPM

Fetch

Fetch

- The Fetch API is a promise-based API for making HTTP requests, Browsers come with a global fetch() function that we can use to make requests.
- The Fetch API can make GET, POST, PUT, PATCH, DELETE and other kinds of HTTP requests. We'll focus on two of the most common methods used in HTTP requests: GET and POST.

Get Syntax:

- In the first line we use the global fetch() function to send a GET request to our API. The argument of fetch() is the URL with the server-side resource.
- We then chain the promise with the then() method, which captures the HTTP response in the response argument and call its json() method. The json() method parses the response body to a JSON object. However, it returns that as a promise.
- That's we why use then() once again to chain another promise, which logs the parsed JSON to the console.

```
fetch('https://jsonplaceholder.typicode.com/posts/1')
   .then(response => response.json())
   .then(json => console.log(json));
```

```

Print Response in React

- Convert Data into JSON to String
- {JSON.stringify(this.state.map.arrayname)}
- {console.log(this.state.map.arrayname)}

Update Data in State

- Define Blank Array in State
- After Loading JSON Data Assign it to Array using State.

```
